

Seitec Genetics

Seitec Genetics develops and sells hybrid corn seed in the United States, Mexico, and has recently sold into eastern European and northern Middle Eastern markets. Seitec utilizes proprietary methods and one of the most modern, seed safe seed conditioning plants in the United States to deliver the highest quality seed. We can provide certified organic and verified non-GMO seed to international customers.

Products Offered

Leading varieties of non-GMO and organic seed corn

Seitec Genetics is an independent seed company dedicated to delivering rare and uncompromising value. Many seed brands are focused on the GMO traits their parent company offers which limits their genetics and market reach. At Seitec Genetics we have maximum flexibility to offer the very best traits and genetics through licensing agreements across all leading developers and utilizing our internal corn genetics development program to match farmer needs.

While many seed brands bypass hybrids with regional advantages to instead work with fewer hybrids, we deliver the very best hybrids for local areas. As we continue to push yield levels higher, top-yielding hybrids need specialization for their environments to capture their top yield potential. We help farmers capture those top yields by aggressively testing a broad set of genetics to deliver the hybrids for their specific area. We also use VigorShield™ to share actual germination test results with you, which includes a stress-induced saturated cold test. It's all about working with a seed company that truly prioritizes the farmers' best interests.
