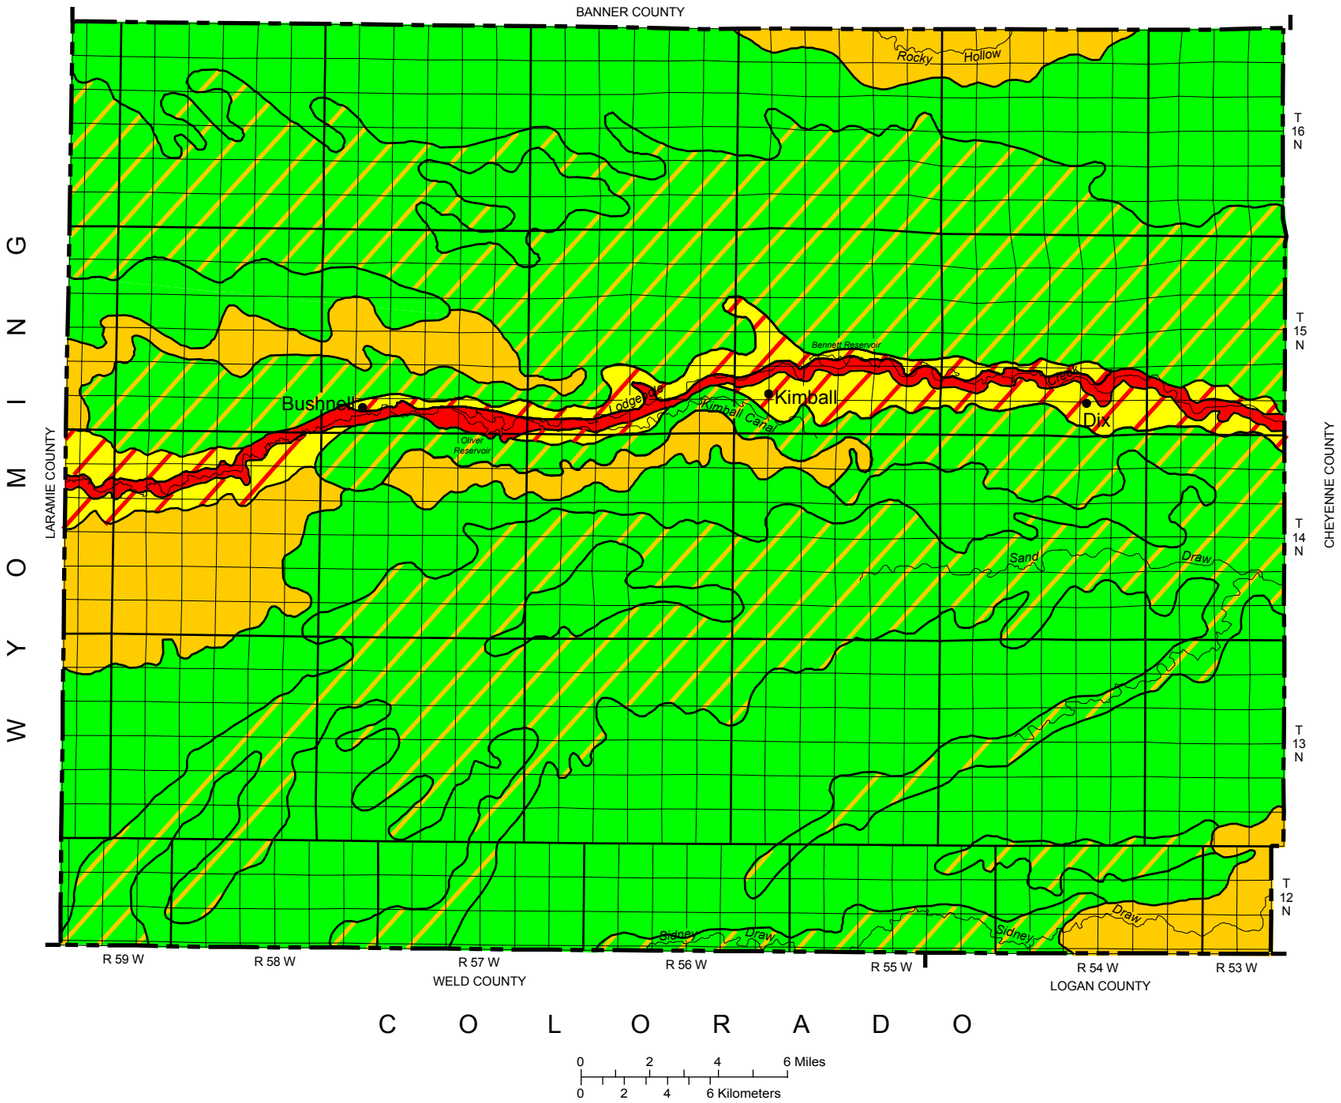
Pesticides and Groundwater

An Applicator's Map and Guide
to Prevent Groundwater Contamination

Kimball County



Sand, loamy sand and sandy loam soils with little organic matter and a water table less than 30 feet below the surface.
These areas have a high vulnerability for groundwater contamination.

Sand, loamy sand and sandy loam soils with little organic matter and a water table greater than 30 feet below the surface.
These areas have a moderate vulnerability to groundwater contamination. Even though the water table is greater than 30 feet below the surface, the soils are porous and caution should be used.

Generally silty and loamy soils with a water table less than 30 feet below the surface.
Much of this area has a moderate vulnerability to groundwater contamination because the water table is less than 30 feet below the surface. Some parts have sand, loamy sand or sandy loam soils with little organic matter and high vulnerability to groundwater contamination. Extreme caution should be used in sandy areas. Caution should be used throughout the entire area.

Silty and loamy soils with a water table greater than 30 feet below the surface.
These areas have a slight vulnerability to groundwater contamination.

Generally silty and loamy soils with a water table greater than 30 feet below the surface.
Much of this area has a slight vulnerability to groundwater contamination. Some parts have sand, loamy sand or sandy loam soils with little organic matter and moderate vulnerability to groundwater contamination. Caution should be used in sandy areas.

The vulnerability of groundwater contamination was determined using soil properties and depth to groundwater as indicated in general on pesticide labels. ***Refer to the accompanying discussion and index of pesticides for guidance on pesticide use.*** Areas on this map may have dissimilar soil and groundwater characteristics from those generally identified for that area.
