

Pesticides and Groundwater

*An Applicator's Map and Guide
to Prevent Groundwater Contamination*

McPherson County

Sand, loamy sand and sandy loam soils with little organic matter and a water table generally greater than 30 feet below the surface.

Much of this area has a moderate vulnerability to groundwater contamination because the soils are porous. Some low-lying parts of the area may have high vulnerability to groundwater contamination because the water table is less than 30 feet below the surface. Caution should be used throughout the area and detailed maps should be consulted concerning low-lying areas.

The vulnerability of groundwater contamination was determined using soil properties and depth to groundwater as indicated in general on pesticide labels. Areas on this map may have dissimilar soil and groundwater characteristics from those generally identified for that area. More detailed information can be obtained from:
